Fun Graph

2 straight lines

Constant Acceleration

Analysis

1. the velocity graphs have drop offs where the position ones do not.
2. the distance and displacement of the tracked object.
3. We had net 0 velocity for the most part except for two small blips when the target moved a tiny bit.
4. I believe it is polynomial because the slope is too gradual to be exponential.
5. the speed of the object
6. 1250 cm^2
7. 625 cm^2
8. There are sharp peaks in the fun graph due to rapid increase of velocity and in the straight line graph they form rectangles.
9. This is what we need the line of best fit for, because my partner did not send me screenshots of the graphs with a line of best fit I am unable to answer this question, I understand we need a line of best fit because it will allow us to create a shape to then find the distance traveled with by calculating the area of the shapes under the line.
