Name: Emma Kadlecek
Group Members: Tyrel, Ryan
Date: 09/20/2026
Period: 7

Name	Activity	Distance (m)	Time (sec)	Average Speed (m/s)
Ryan	walking	5m	3.44	1.45
Tyrel	walking	5m	4.26	1.17
Emma	walking	5m	4.39	1.13
Ryan	running	5m	1.13	3.75
Tyrel	running	5m	2.26	2.26
Ema	running	5m	1.66	3.01

Name	activity	distance	time	avg speed
Ryan	running	5m	1.13	3.75
Ryan	running	5m	1.98	2.52
Ryan	running	5m	1.51	3.31
Ryan	running	5m	1.69	2.95

AVG Ryan: 3.13
Speed = $\frac{d}{t}$ which would be $\frac{5}{1.13}$ which is about 3.75

Name	activity	distance	time
Ryan	running	12.39	4.11
Ryan	running	12.39	3.95

Analysis

1. 1 second: 3m
   2 seconds: 6m
   3 seconds: 9m
2. no it is the average of all the speeds it will be weighed down so to speak by slower speeds.
3. strap a speedometer to the racer and track the speed on a graph.
4. We chose Ryan because he volunteered to do it and he had the highest average speed.

1. We manually told him to start instead of having a buzzer go off.
2. We manually started the stop watch which could be delayed compared to when he started running.

5. 6.97

   2.23 *speed = mph*

   2.23 3.13 = 6.97
6. 29.14 m/s
7. Actual distance 16.9, % Err = $(\frac{(calculated-actual)}{actual}) \times 100) = (\frac{(12.39-16.92)}{16.92}) \times 100) = -23\%$, I think it's negative because the calculated is smaller than the actual

Conclusion: distance = 16.92 m

1m = 100 cm

at 1 cm/s the rover would take 1,692 seconds which is about 28 minutes
